SAFE AND SECURE UPDATES

The IoT problem - causes

- **Mass production** of IoT devices  doesn't go in pair with their **quality** 
- IoT devices are prone to **software errors, security vulnerabilities,** and **maintenance hell** - especially in large groups
- All IoT devices are **attack vectors** (data theft, removal, ransomware)
- **Difficult to update**, manual updates, expensive, problematic, and time consuming

The IoT problem - results

- **Difficult to manage**, especially when highly distributed in space with weak network connectivity
- **Difficult to update**, manual updates, expensive, problematic and time consuming,
- **Affecting manufacturers and integrators from all industrial branches:** robotics, sensors, Industry 4.0 devices

SAFE AND SECURE UPDATES

How does it work?

Management

CELLULAR NETWORK RANGE

- Security updates
- Reconfigurations
- Certificate rotation
- Anomaly detection
- Parameter monitoring
- many, many more...

Modino.io vs manual updates

- **Use case:** Photovoltaic power station
- **Owner:** TAURON Energia (Poland), 37 MW of power, 140 inverters

	Manual update	Modino.io
Time to update 1 inverter	~30 minutes	~2 minutes
Time to update all inverters	70 h = 9 working days (plus travel, hotel and accommodation costs of specialist)	~2 minutes

- **Average attack costs** (which disables 50-100% of inverters) is **1700 - 3500 EUR / h**
- Attack costs = lack of possibility of conducting business = selling energy

NEW EU SECURITY LEGISLATION UNDER THE RADIO EQUIPMENT DIRECTIVE (RED)

To increase the level of cybersecurity, personal data protection and privacy

SUBSCRIBE FOR INFORMATION

CONTACT US

On the 12th January 2022, the European Commission updated the Radio Equipment Directive (RED), which establishes a regulatory framework for placing radio equipment on the market, to include additional legislation related to security (2022/30/EU)¹.

The Commission adopted a Delegated Act of the Radio Equipment Directive activating Articles 3(3)(d), (e) and (f) for certain categories of radio equipment to increase the level of cybersecurity, personal data protection and privacy.

The update mandates cybersecurity, personal data and privacy protection for devices that can:

- 3.3d: communicate over the internet, either directly or via any other equipment
- 3.3e: process personal data, traffic data or location data
- 3.3f: enable users to transfer money, monetary value or virtual currency

These provisions become mandatory on the 1st August 2024 and manufacturers of radio connected devices must be compliant by that date or face potential action.

The reason behind this is that more and more products are employing radio technology in their applications and many of these devices connect to the internet which could expose these products to increasing security threats and the potential to be attacked and exploited.

2022

Competitive advantages

- **Universal solution** – machines, sensors, robots, smart grid, information systems, measuring stations, IP cameras, medical devices, servers, edge cloud (with OS installed)
- **Not hardware bound** – software delivery independent of customer's hardware (for Linux based systems)
- **Strong applied cryptography** – your data is yours, Modino cannot access it since data is encrypted by client keys
- **Ensured business continuity** – devices are never offline, automatic rollback procedure in force
- **Updating 1 or 1,000 devices takes the same amount of operator time;** updates can be made either ASAP (in case of attacks) or in cohorts (minimizing business impact).
